## OPPORTUNITY TO SELECT STUDENTS CAPABLE OF ENTERING THE TEACHING PROFESSION

**Abstract:** This goal can be achieved only if the training of future teachers for innovative approach to the educational process is organized. All work on professional orientation, selection and training of qualified personnel - one and the same - are carried out in close interrelation with each other and each of these activities - training of future teachers to organize the educational process on the basis of skillful new pedagogical technology will contribute to the achievement of a specific goal as a whole system, its effectiveness will meet the requirements and will be easy to control.

**Key words:** determination of abilities and aptitudes, formation of students' practical skills and abilities, content of acting, music, pedagogical profession

The problem of further improving the training of future teachers also depends on solving the problem of preparing them for an innovative approach to the educational process. Because nowadays new pedagogical technologies are introduced into pedagogical activity

Therefore, the process of teacher training - referral to the profession, selection of professionals, preparation for the profession - must be directed towards this common goal. It is a very complex process that requires precision, skillful management and control.

This goal can be achieved only if the preparation of future teachers for an innovative approach to teaching is organized. All work on professional orientation, selection and training of qualified personnel - one and the same - are carried out in close interrelation with each other and each of these activities - preparation of future teachers to organize the educational process on the basis of skillful new pedagogical technology will contribute to the achievement of a specific goal as a whole system, its effectiveness will meet the requirements and will be easy to control.

The approach to preparing future teachers to the innovative approach in the educational process as a whole system includes each of its elements, i.e., the direction to the profession, the preparation of capable of

Firstly, in the course of our research it was found that motives are of primary importance in the sphere of achieving effective or ineffective results in pedagogical activity;

secondly, it is in this area that we found many shortcomings in the process of innovative organization of the educational process or pedagogical practice.

Our research proves that an important internal source of the approach to the educational process based on pedagogical technologies is its orientation to professional training. The new process of preparing students to organize the educational process on the basis of new technologies includes the system of selection and preparation of students capable of teaching profession in school, selection and continuous training of future teachers in teacher training colleges and academic lyceums. One of the peculiarities of this training is that the teacher applies various spiritual forms of pedagogical communication, sincerely communicates with students.

We paid attention to the fact that by involving students in the work of directing them to the profession, they form practical skills of pedagogical activity. Firstly, it forms students' practical skills and skills, and secondly, it develops motives of interest to work with students, and they look for new ways and methods of working with them.

On the other hand, the most important stage in preparation for “ the profession of teacher ” is the selection of students according to their abilities and aptitudes. Fourthly, the improvement of career guidance work will help teacher training institutions to prepare teachers who are capable of professional training, successfully pass the test, achieve effective results in the professional training stage and have a special significance in practical work. Two important tasks must be accomplished in order to successfully accomplish these tasks:

Thus, special attention was paid to the development of motives, showing in the student the content of the teaching profession and its diversity. Therefore, we proposed students to organize teaching and education in reference schools indicating different aspects of pedagogical activity.

Modern scientific and technological development requires us to provide teachers who are up-to-date, who constantly improve their knowledge, who are able to understand innovations in science, to communicate them to students, to equip students with sufficient knowledge in this field, and to be innovative in their approach to education. We have begun to explore how to “educate the teacher”. Attention is paid to the fact that every lesson and practical training in pedagogical subjects is based on pedagogical technology.

In pedagogical technology the definition of the goal, its clarification, definition of the main concepts in the report, setting and solving problems requires their solution on the basis of an innovative approach with the involvement of students in the discussion of some problems with active participation. This contributes to the formation of students' specific skills and abilities, as well as skills of independent work on the basis of new pedagogical technologies.

Such activities were organized on Saturdays and Sundays in all districts of Kashkadarya province. Students were also widely involved in the organization of educational work in these schools. Because the fact that “students who have come of age” organize educational work arouses students' interest and encourages them to test their abilities. The closeness between pupils and students makes them even more interested in their teaching profession.

Secondly, this kind of work is important in the professional training of students. Because they do it by “ getting closer to the students, showing them their experiences ”
